The presence and induction of cytochrome P450 were studied in rat lenses infected with two species of trematodes of the family Opisthorchiidae. Fresh tissue samples were taken from lenses, and partially purified cytochrome P450 was extracted using n-butanol. The pattern of detectable P450 was very specific for each nematode. Hence, male *opisthorchis felineus* induce mainly a C21-bifunctional P450 while female specimens induced a C21-monofunctional P450. A similar pattern was also present with *Ascaridia polyphaga*, and the major type of cytochrome was again exclusively a bifunctional P450. The experiments with *A. polyphaga* imply that a different mechanism of induction must be the reason behind the specific type of P450 the two opisthorchid worms induce. This hypothesis is supported by the fact that induction of the P450 from *A. polyphaga* was not due to a primary effect of the trematode on host tissues, but to a secondary effect since it was induced by the release of the parasite into the host's body cavity. This effect was only possible in the lensectomized state. The mechanism behind the specific induction of P450 from *opisthorchis felineus* is less obvious, but it is suggested that a two-fold mechanism may be at work. In our "Battle of the Apps" feature, we compare notes on the apps available for each platform. I'm a big fan of Amazon Music. It's easy to get and easy to use. It's available on many different devices. But I had to use it for a while when Apple Music was completely inaccessible, and while Spotify sometimes had issues with my long-distance iPhone calls. That's where Amazon Music Unlimited comes in. With it, you can use any iOS device, enjoy access to your
