To evaluate the usefulness of a new digital cytology analysis system for the detection of abnormal cytology. In a case-control study, we assessed the diagnostic potential of the new digital cytology analysis system for the detection of abnormal cytology. The study included 2241 cervical smears obtained from 1665 women who presented to outpatient clinics in the period September 2003 to March 2004. A standard cervical smear was compared with a digital image analysis system and then rescreened with Papanicolaou stain. A total of 132 women (6%) had abnormal cytology. Overall, 26.2% of the smears were considered unsatisfactory and of those, 4% were false-negative cases (i.e. normal Papanicolaou smear but abnormal digital cytology). Using the conventional screening method, a false-negative rate of 9.7% was found. Considering a threshold of at least 1 abnormal cell in every 20 well-preserved and stained cells, the sensitivity of the new digital cytology system was 93.5%, the specificity 97.3%, the false-negative rate 6.5% and the false-positive rate 8.2%. The new digital cytology analysis system for cytology analysis is a valid method for screening cervical smears, as the false-negative rate is low (6.5%). ca3bfb1094
