Despite the fact that Photoshop is a monster, it can be customized to look just like Illustrator by getting the two programs to use the same layers. Downloading and installing Photoshop Adobe Photoshop is available as a disc or download for $129. You can get both disc versions and the downloadable version by going to the Adobe website (www.adobe.com). Photoshop requires a Macintosh, a Windows PC, or a Unix machine to run. You use the download version if you have access to a computer at Adobe or an Internet café. As a practical matter, the optical disc version is the one you'll use. If you plan to paint digitally (use layers to create different aspects of an image), then Photoshop is the right program for you. If you want to experiment with Photoshop and play with its tools, the disc version is the one for you. The download version is more like the online version where you install bits and pieces of the program, and that's what you need if you're just trying to figure out how to use Photoshop. When you install Photoshop, you give it control over your computer's display settings, so you can have it display the toolbar on the computer screen, and you can choose to use the program either in full screen or in windowed (not maximized) mode. If you're going to do any serious editing with Photoshop and want a truly powerful program, you'll want to get the disc version, which lets you run the full version of Photoshop with all of the tools and features. After you install Photoshop, you can choose to add it to your computer by displaying the Adobe Creative Suite Library when you start your computer, using a disc that has the program on it, or downloading the program from the Adobe website at the time you install the program. Creating a file in Photoshop The workflow for most users is that you open a file in Photoshop, make some modifications, and save the file when you're finished. The way Photoshop saves the file is by default, as a layered file, with the file extension PSD. Working with Layers in Photoshop In the Layers panel, Photoshop allows you to create multiple shapes and separate those shapes with the use of layers. In the following steps, I show you how to create a new layer, add some other layers, and how to combine layers into a group. 1. Choose File⇒New. The New dialog

Q: Database schema for multiple tables with the same primary key I have a scenario where I need to provide some datas via a CMS, these data is managed via a Tableau Server application. When I insert a new row I want to duplicate these datas in a other table via a INSERT INTO Table1 SELECT * FROM Table2 In my case I need to add a column to my "Table2" that is not a primary key. Therefore I will have to add a unique index to make sure that the "Table1" do not get duplicated when I do a insert in Table2. I wonder what is the best practice or common way of doing this? Is it better to have a unique index and perform the duplicate add with a where clause? A: You can use a trigger to capture the insert into table 2 and then do the insert into table1. The advantage of using a trigger is that you don't need to rewrite your select from table2 into a insert statement. Just use the trigger and you're good to go. Q: How to take screenshot of an element that can be in various states? I'm trying to take a screenshot of an element and save it in a list. I can do it for elements that are initially expanded but I cannot do it for elements that are collapsed. How can I take a screenshot of an element that can be collapsed? I've tried to take a screenshot with three ways but it doesn't work. getToolkit().createScreenCapture(new Rectangle(100, 100, 200, 200)); This screenshot is good but it only works when element is initially expanded. new Robot().keyPress(KeyEvent.VK_SC).keyRelease(KeyEvent.VK_SC).createScreenCapture(new Rectangle(100, 100, 200, 200)); This screenshot is not good because it only works when element is initially expanded. new Robot().keyPress(KeyEvent.VK_SC).keyPress(KeyEvent.VK_1).keyPress(KeyEvent.VK_SC).keyRelease(KeyEvent.VK_SC).keyRelease(KeyEvent.VK_1).keyRelease(KeyEvent.VK_SC).createScreenCapture(new Rectangle(100

Q: Copy datagridview content from one form to another form and format the values my application has 2 forms. 1 that has a datagridview (DataGridView1). Form2 has an empty datagridview (DataGridView2). Now the problem is. How do I copy the content of DataGridView1 to DataGridView2 as long as all the rows are still in form 1. I do not want to move the data to a file or object as I want to be able to edit the contents of my datagridview1 whenever I want so I am not planning to move the data to a database. I have tried the following but it does not work. try { DataTable dt = new DataTable(); dt.Columns.Add("ID", typeof(int)); dt.Columns.Add("Task", typeof(string)); dt.Columns.Add("Completed", typeof(bool)); DataRow dr1 = dt.NewRow(); dr1["ID"] = myObject.ID; dr1["Task"] = myObject.Task; dr1["Completed"] = myObject.Completed; DataGridView1.DataSource = dt; //I get an exception that ID is already in use } catch(Exception ex) { MessageBox.Show(ex.ToString()); } A: I don't think this is an issue of saving to disk but instead copying the data to a new DataTable. You need to create the DataTable that you are going to copy the data to and assign this
