Four cases of pyriform sinus teratoma are presented with CT and MR tomographic findings. Three of them were pre-surgical in nature with CT, and MR was only used at the end of treatment. The fourth case was obtained by CT post-mortem. The combination of bronchography, CT and MR constitute the cornerstone of the pre-surgical diagnosis. Mesenchymal stem cells can promote beneficial effects in experimental autoimmune encephalomyelitis. Multiple sclerosis is a chronic disease characterized by inflammation and demyelination of the central nervous system. Autoimmunity against myelin antigens is believed to play a central role in the development of the disease. Mesenchymal stem cells are immune privileged cells that possess a wealth of properties, which make them attractive candidates for the treatment of multiple sclerosis. In the present study, we tested whether mesenchymal stem cells can be utilized in an experimental model of multiple sclerosis. Mesenchymal stem cells transduced with a lentiviral construct overexpressing a secretable form of human transforming growth factor beta 1 were transplanted into mice with experimental autoimmune encephalomyelitis. Transplantation of mesenchymal stem cells with TGF-beta1 overexpression resulted in significant amelioration of paralysis symptoms in mice with experimental autoimmune encephalomyelitis. These findings demonstrate the potential for mesenchymal stem cells in treatment of multiple sclerosis. { "editors.display.codemirror": { "codemirror.action.codemirror.displayDifferences": "Mostra le differenze fra codice", "codemirror.action.codemirror.showDifferences": "Mostra le differenze fra codice", "codemirror.action.codemirror.toggleSideBySide": "Mostra/Nasconde la visualizzaione in modo parallelo", "codemirror.
