Honestech Tvr 2.5 Product Key. honestech .1. Field
of the Invention This invention relates to the art of
information processing and, more particularly, to
computer systems in which a transaction is
requested by a user and a response is
communicated by the system to the user in a
manner which protects the integrity of system
functions and data. 2. Description of the Prior Art
There are many types of transaction systems in
which transactions must be authenticated or
confirmed by the system for security purposes. For
example, in a typical electronic cash system the

user of an agent station places an order for purchase of an item at a merchant station. The purchase order is authenticated by the system, indicating that the order and its authenticity have been accepted by the system. The purchase order is then accepted by the system, permitting the system to pay to the merchant the amount of the order minus a transaction fee. The order is maintained on a database and the computer file corresponding to the agent station can be modified to reflect the event. Of course, for the transaction to be functional the transaction fee must be paid. In such a system, it is important that the conditions of the order are authenticated. If they are not, the system cannot be certain that the transaction is authentic. Further, it is important that the order be properly accepted by the system. If it is not, the system cannot be certain that the order has been accepted properly. However, in such a transaction system it is desirable to also protect system functions and data from malicious attacks. A malicious attack can take many forms. For example, a hacker could attempt to "race" between an authenticated transaction and an unauthenticated transaction to purchase the same item. A hacker could attempt to modify system functions or data to unfairly advantage one party or another. In one prior art system (prior U.S. patent application Ser. No. 237,985), the system must first

validate whether or not a transaction is to occur between a system user and a merchant's agent. The system will not complete a transaction until such validating has been completed. In this system, the system requires a user request

$$\frac{1}{2}$$

$\arcsin\left(\frac{2x-3}{1+x^2}\right) + 3x$ I did:

$$\frac{1}{2}$$

$$\arcsin\left(\frac{2x-3}{1+x^2}\right) + 3x = \frac{1}{2} \arcsin\left(\frac{2x-3}{1+x^2}\right) + 3x - \frac{3}{2} \arcsin\left(\frac{2x-3}{1+x^2}\right) - \frac{3}{2} \arcsin(1)$$

$$= \frac{1}{2} \arcsin\left(\frac{2x-3}{1+x^2}\right) - \frac{3}{2} \arcsin(1)$$
