"Natural Selection is an application that allows you to use the actual evolution of animals as a basis for the evolution of others. It has a list of dozens of possible mutations and genes, each having a number of characteristics. To start it, the user needs to designate a starting species or type of animal, and provide a simulation environment. For each species, a time period can be established, and new mutations can be added. The ability to add mutations such as brown fur, long tails and long teeth, as well as survival factors such as wolves, food, and the ability to toggle between an Arctic and Equator environment, are also included. After the user has established the initial conditions, he can view the main window, which shows a graphical representation of the evolution. The user can also click on the final results of the evolution and view the pedigree chart, the cartoon animation of the evolution, the results of the mutations, and other information. The user can also pause the simulation and go to the next step, as well as save the current state of evolution to the hard drive. The interface and interface are usable, although it is a little hard to figure out at first. There are no known errors, crashes, or bugs. What's New in the?

Natural Selection is a free and open-source software which enables you to view how a particular bunny population will evolve in custom circumstances. You can view the evolution of rabbits under different conditions, by adding mutations such as brown fur, long tails, and long teeth, establishing which genes are dominant, inserting survival factors such as wolves and food, and toggling between an Arctic and Equator environment. You can pause the time in between

simulation steps and go manually to the next step in rabbit evolution. You can also save configurations on the hard drive, so that you can use them later. Other features include:

- Trees: you can view the genetic trees and pedigree charts for the population you are working with.
- Pedigree charts: the parent-child relationship between each individual is presented by genetic lines.
- Reproduction: you can view the population's reproduction statistics, for example, mating pairs and reproductive births.
- Pre- and post-death statistics: the population's death and birth rates are presented.
- Statistical view: you can view the population's statistical view in different forms, such as a population graph and a donor graph.
- Twins: you can view twins being born, and if there is a 50 percent chance of the twins surviving.
- Allele frequency: you can view the frequency of all the alleles in the population, and their relationship to each other.
- Miscellaneous statistics: all the statistics are presented in a tree that displays their levels.
- Individuals and groups: you can filter the individuals and groups according to their sub-breed and level in the tree.

Customization The user interface is designed to be operated with a mouse. The program doesn't require any installation, as it is a portable piece of software.
